

Task: Create 3–4 AI-Generated Viral Reel Videos

What You Are Building

Short-form videos (Reels / Shorts / TikTok) designed to maximize visibility for authors on social media. We are building this workflow for a real client. Use his face as the character in your videos (reference images are in the assets folder). The goal is not just to make pretty clips. We want to find a repeatable, high-quality workflow that we can later turn into an agentic pipeline for bulk production.

We want to see whether you can:

1. Use AI tools creatively instead of only following basic prompts.
2. Maintain visual consistency across multiple scenes.
3. Discover useful AI tools beyond the tools already suggested.
4. Think like a content strategist, not only like an engineer
5. Explain how this workflow could become an automated agentic system.

This round is not just about producing videos. It is also about showing your thinking, research ability, taste, and execution quality.

Core Output Required

You need to submit:

- 3–4 final AI-generated videos
 - Each video should be around 60 seconds
 - Format: Vertical reel format, 9:16 aspect ratio
 - All outputs should be uploaded to a Google Drive folder
 - You should also include a short written explanation of your workflow and suggestions
- Note: Workflow and suggestion will be discussed in your interview. Be thoughtful, we are evaluating how you think, not just what you produce.

Recommended Workflow

Note: Its just a suggested workflow, feel free to think of your own. As long as we can get desired output.

Step 1: Choose a Strong Storyline

Start by selecting any one story from the story ideas document.

Step 2: Turn the Story into a 60-Second Reel Script

Break the story into 6–7 short scenes.

Each scene could include:

- Visual description
- script line

You can use ChatGPT to brainstorm, but do not rely only on generic AI-generated story ideas. If the story feels bland, improve it yourself.

Step 3: Collect Strong Visual References

Before generating images, collect strong visual references.

These can come from:

- YouTube videos
- Shorts/Reels/TikToks
- Illustration styles from the internet
- Existing AI-generated animations
- Artists/designers whose visual style fits the story
- Movie stills or cinematic references

Step 4: Create Illustrated Scene Images

For each scene, generate a still illustration before animating.

Tool: ChatGPT (image generation)

How:

1. Upload your style reference (from Step 1)

2. Upload the client's face / character reference (from assets folder)

3. Prompt for the specific scene

Illustrated stills give you more control over quality than jumping straight to video generation.

Story's Prompt:

Suggest me some for reels under 60s to visualize this story of part of it and to go viral

Create an illustration visualizing this scene in exact same design style as attached image, include the following person in this scene.

Scene:

Night, Back alley behind a restaurant. A dishwasher in white apron quietly opens a kitchen door, looks around, and drops a wrapped premium steak into an outdoor dumpster. Moody lighting. Suspensful, almost like a crime scene.

How you'll be evaluated

1. Output quality — nothing beats this. Do whatever it takes to get the best result.

Retry, switch tools, refine prompts, edit heavily — the final video is what matters most.

2. Innovation in workflow — we highly appreciate if you come up with your own approach. The workflow below is for reference only. If you find a better path, use it and explain why. That is exactly what we want to see.
